Note 1: Age-Adjusted Rate per 100,000 people. For example, In 2012, about 23 in every 100,000 Wyoming residents died by suicide. This rate was adjusted to account for the fact that people are expected to die at an older age. Please refer to the technical definition of age-adjusted rates on page 36 of this document.

Note 2: Caution should be used in the interpretation of vital statistics rates which are based on a small population or a small number of events. For example, Niobrara rate has seen great fluctuations from year to year, but the numbers are very small.
